
SUMMARY OF QUALIFICATIONS

- Gained practical experience in system administration and cybersecurity monitoring through hands-on labs and simulated environments.
- Applied Splunk, Sysmon, and Active Directory to analyze security events, detect brute-force attacks, and validate threat detection workflows.
- Tested network vulnerabilities using Kali Linux for penetration testing and Wireshark for traffic analysis.
- Executed brute-force simulations (e.g., Hydra) to identify security gaps and validate defensive protocols.

TECHNICAL SKILLS

Security Tools: Splunk, Sysmon, Wireshark, Kali Linux, Universal Forwarder

Networking: DNS/DHCP, TCP/IP, VPN, SIEM fundamentals

Operating Systems: Windows, Linux (Kali), macOS, Android/iOS

Languages: Python, SQL, PowerShell, Java, C, C#, C++, Typescript, Javascript

Certifications: Google IT Support Professional (Dec 2024)

EDUCATION & CERTIFICATES

Bachelor of Arts in Computer Security | York University | Expected 2029

- Relevant Coursework: Network Security, Ethical Hacking, Incident Response

Computer Systems Technician Diploma | Sheridan College | Sept 2022 – Apr 2024

- Coursework: Network Administration, Cybersecurity Fundamentals, Database Management

Junior IT Analyst Bootcamp Program | NPower Canada | Sept 2024 – Dec 2024

- Configured Windows/Linux systems, managed Active Directory, and applied Agile methodologies.

PROJECTS

Active Directory Security Simulation Project ([GitHub](#)) | March 2025

- Built a multi-department AD environment with Sysmon, Splunk, and Universal Forwarder integration.
- Simulated a brute force attack from Kali Linux to validate detection and incident response.
- Tracked failed logon attempts and source IPs for security auditing

Log Jammer With Splunk ([GitHub](#)) | March 2025

- Analyzed Windows Event Logs to trace suspicious user behavior and firewall changes.
- Developed detection for scheduled tasks, malware events, and abnormal PowerShell executions.
- Documented threat hunting and incident response in a detailed GitHub report.

Brutus Lab Investigation ([GitHub](#)) March 2025

- Investigated a brute-force SSH attack by analyzing Linux system logs to identify the attacker's IP, compromised root account, and unauthorized session details.
- Discovered attacker persistence via creation of a privileged backdoor user and mapped activity to MITRE ATT&CK T1136.001.
- Extracted the full command executed by the attacker and documented mitigation strategies, including SSH hardening and user monitoring.
